KEYSENSE AI

where every key meets intelligence

PROBLEM STATEMENT :

“Nowadays, children use smartphones a lot, and sometimes they may type or search for harmful or emotional things — like suicide, violence, or self-harm.
Parents usually don’t know this is happening until it’s too late.”

PROBLEM SOLUTION :

“So, we created KeySense AI Keyboard, a smart keyboard that detects unsafe or emotional words or emojis when children type and sends an alert to parents.”

PROTOTYPE :

We built a custom Android keyboard using Android Studio.
It looks like a normal keyboard but it has extra code inside that:

- Monitors what is typed.
- Detects risky words like ‘hurt’, ‘suicide’, or ‘kill’, and emotional emojis
- Saves these alerts securely inside the phone for the parent to view later in our app.

Future AI Integration:

- Voice emotion detection
- Image & video analysis
- Gesture & face tracking
- Multilingual text support
- Smart alert dashboard

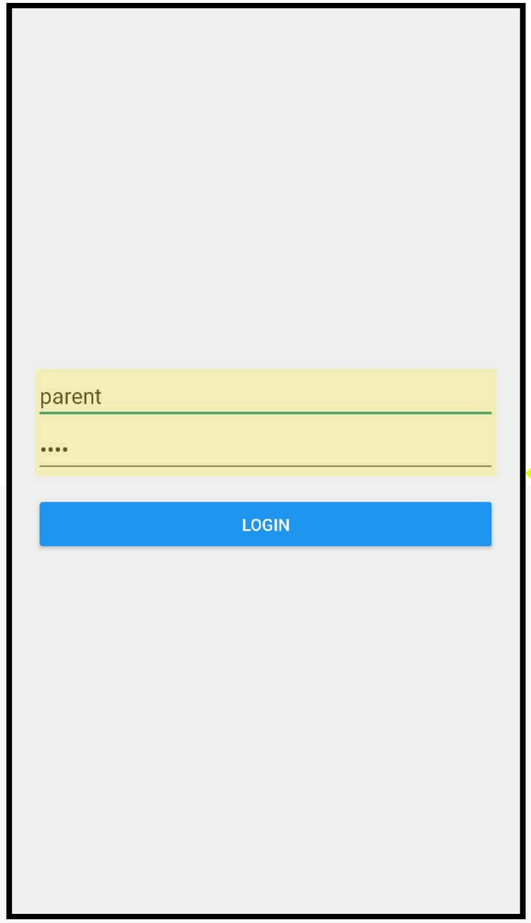
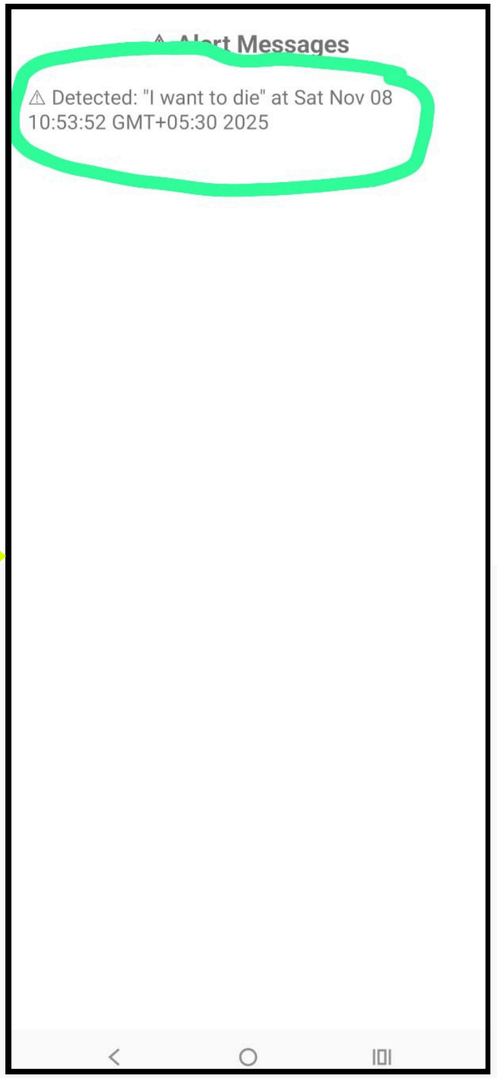
STEP 2



STEP 3

ENTER USERNAME &PASSWORD

A ALERT MESSAGE WILL BE DISPLAYED



STEP 4

TECHNICAL APPROACH

- Built a custom Android keyboard (IME) using Kotlin.
- Added real-time text monitoring to detect risky words/emojis.
- Used SharedPreferences to store and alert parent users.
- Integrated AI modules (future scope) for analyzing text, voice, and gestures.
- Designed a secure parent dashboard for viewing alerts.

FUTURE INTEGRATION WITH AI

- Google Cloud AI / Firebase ML Kit – for text, image, and voice emotion analysis.
- OpenAI API (GPT / Whisper) – for detecting meaning, tone, and intent in text and voice.
- TensorFlow Lite – for on-device emotion or gesture detection (offline and fast).
- Mediapipe by Google – for gesture, facial expression, and pose recognition.
- IBM Watson Tone Analyzer – for detecting emotion and mood in written text.
- Azure Cognitive Services – for speech-to-text and sentiment analysis.
